Statement of Purpose

As I view the world and life as outcomes of Perception, and from my experience with it, I then conclude that

I want to create a video game that reflects how I, as the developer, perceived and lived through the world. So, I created a “Trial” named “Trial of Perception” to seek how people, or in this context, the player perceived and lived through the world, which I didn’t expected 100% accuracy, but rather a result that was convincing enough to prove that my concept about perception is reasonable enough.

By using the GDScript in Godot and making the NPCs react not from the actions but from their Perception, which arises from trust, suspicion, and uncertainty, one action can lead to various outcomes depending on the NPC and context

You may wonder why I selected the principle of “Perception”; it is because, as a guiding rule in my life, Perception affected me in various ways

I am interested in ICT because I found that in this faculty has a department of Games and Gamification, which I lacked in game development, so this will helped me, because my game worked with the principle of “Perception” which can make me improve it by understanding more about Gamification as the idea that work with real-life concept, the core reason is that “Game” is a core concept that I am interested in,

So then, I will continue to make more games that reflect the concept of life, based on various definitions of life, not just a game that is fun to play
